
State behaviors:
Resting state: Starts in this state. Reloads bullets and mortars.

Shooting state: fires bullets at the player until all bullets are expended or player leaves sightline.

Melee attack: If the player enters the trigger zone while the boss is in the shooting state, two arms will come together to crush the player if they don't back away in time.

Mortar mode: if the player is not visible for a few seconds, begin firing mortars at the position of the player's last footstep sound.

Mortar attack: fires a mortar, then keep firing until all mortars are expended

Challenges faced during development:

- Didn't have time to fully implement a polished version of the melee system that could be triggered multiple times, although in the current state you could probably make it so that after you trigger the melee once, you can then go around the stuck arms to hit the boss in a weakpoint from behind or something
- I originally intended for the mortars to launch from the boss with an arcing trajectory towards the player's footstep sounds. I spent alot of time trying to get this to work before instead deciding to just have them fall from the sky
- I originally was going to have separate mortar and turret scripts that would be triggered from the main boss script via events. I had trouble getting this working, so I instead decided to put all of the boss's code on one script.
